Test length doesn't matter, it's how you use the items that counts: An intelligent procedure for item selection in Item Response Theory

Ottavia M. Epifiania<sup>1,2</sup>, Pasquale Anselmi<sup>3</sup>, Egidio Robusto<sup>3</sup> <sup>1</sup> Psychology and Cognitive Science Department, University of Trento, Italy <sup>2</sup> Psicostat, University of Padova, Italy <sup>3</sup> Department of Philosophy, Sociology, Education, and Applied Psychology, University of Padova, Italy

Convegno ASA 2024, Contributed session: Developing, administering and refining measurement instruments in Social Sciences

200

**Typical procedure:** Manually inspecting the item characteristics to recreate the desired characteristics of a test

Automated (new) procedure: A priori definition of latent trait levels of interest on which the STF should be focusing the most

**Typical procedure:** Manually inspecting the item characteristics to recreate the desired characteristics of a test

#### Issue

Not an automated procedure  $\rightarrow$  depends on the subjectivity of the researcher

Automated (new) procedure: A priori definition of latent trait levels of interest on which the STF should be focusing the most

### Issue

Punctual definition of the specific latent trait levels of interest influences the number of selected items

**Typical procedure:** Manually inspecting the item characteristics to recreate the desired characteristics of a test

### Issue

Not an automated procedure  $\rightarrow$  depends on the subjectivity of the researcher

Automated (new) procedure: A priori definition of latent trait levels of interest on which the STF should be focusing the most

#### Issue

Punctual definition of the specific latent trait levels of interest influences the number of selected items

### AIM

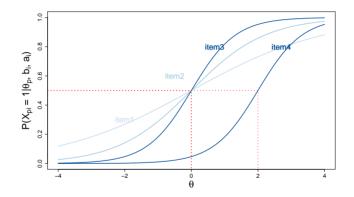

New automated procedure for item selection in IRT that only requires the definition of the desired characteristics of a test

ILA

LItem Response Theory and Information Functions

 ${}_{2}$ -Parameter Logistic Model

$$P(x_{pi} = 1 | \theta_p, b_i, a_i) = \frac{\exp[a_i(\theta_p - b_i)]}{1 + \exp[a_i(\theta_p - b_i)]}$$

 $\theta_p$ : Latent trait level of person p

- $b_i$ : Location of item i on  $\theta$
- $a_i$ : Discrimination ability of item i

ILA Litem Response Theory and Information Functions Litem and Test Information Functions

Item Information Function (IIF):  $I_i(\theta) = a_i^2 P_i(\theta, b_i, a_i) [1 - P_i(\theta, b_i, a_i)]$ 

## Test Information Function (TIF): $I(\theta) = \sum_{i=1}^{N} I_i(\theta)$

ILA └─Item Selection Procedures └─Item Locating Algorithm - ILA

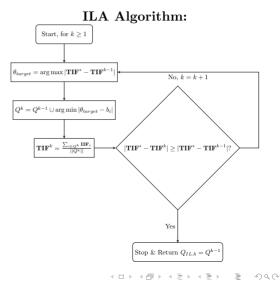

## Set up:

 $N{:}$  number of items included in the item bank

 $Q^k$ : Set of item indexes selected for inclusion in the STF up to iteration  $k \ (Q^0 = \emptyset)$ 

 $\mathbf{TIF}^*$ : TIF target

 $\mathbf{TIF}^0 = (0, 0, \dots, 0)$ 

ILA Litem Selection Procedures Brute Force Procedure – BFP

For each  $Q_m \subset Q$  with  $Q_m \neq \emptyset$ , calculate:

$$\mathbf{TIF}^{Q_m} = \frac{\sum_{i \in Q_m} IIF_i}{||Q_m||}$$

$$\mathbf{\overline{\Delta}_{TIF}^{Q_m}} = mean(|\mathbf{TIF}^* - \mathbf{TIF}^{Q_m}|)$$

 $Q_{BFP} = \arg\min_{\emptyset \neq Q_m \subset Q} \Delta_{\mathbf{TIF}^{Q_m}}$ 

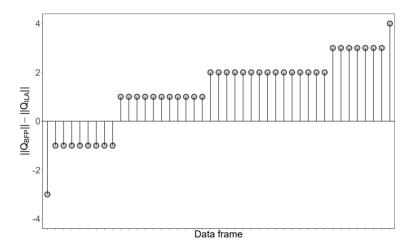

### 100 data frames:

- ① Generate an item bank B of N = 6 items:
  - Difficulty parameters:  $\mathcal{U}(-3,3)$
  - Discrimination parameters:  $\mathcal{U}(.90, 2.0)$
- 2 Random item selections of lengths l from B  $(M_l = 3.34 \pm 1.13) +$ modification parameters  $\mathcal{U}(-0.20, 0.20) \rightarrow \mathbf{TIF}^*$
- **3** Considering  $\mathbf{TIF}^*$  at Step 2 and item parameters at Step 1:
  - $\bullet \ {\rm ILA} \to \textit{Forwardly searches}$
  - $\bullet~\mathrm{BFP} \to Systematically~tests$

 ${\bf Comparison:}$ 

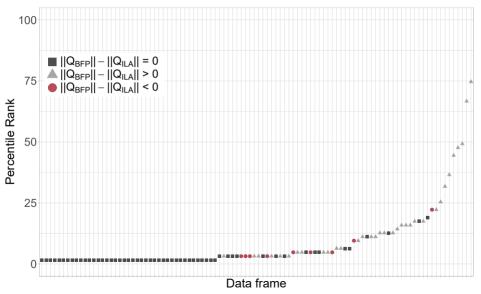

- $||Q_{\rm BFP}|| ||Q_{\rm ILA}||$
- $\bullet~{\rm Percentile~rank}~({\rm RP})$  of the distance  ${\bf TIF}_{\rm BFP}-{\bf TIF}_{\rm ILA}$

ILA  $\sqsubseteq$  Simulation Study  $\sqsubseteq ||Q_{BFP}||$  vs.  $||Q_{ILA}||$ 

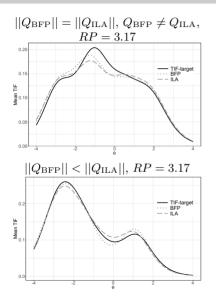

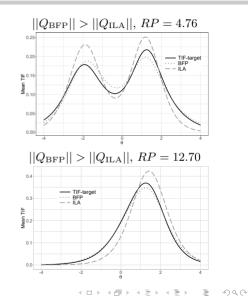

# $||Q_{\rm BFP}|| - ||Q_{\rm ILA}|| = 0$ in 57% of cases

ILA └─Simulation Study └─TIF comparison

# Pros of ILA

- It selects items that are able to recreate the desired characteristics of a test (usually)
- It is computationally "Light"

# Cons of ILA

- It grounds its selection on a single  $\theta_{target}$  at a time  $\rightarrow$  it might select items minimizing the distance on that target but that are not very useful for the test
- $\, \circ \,$  It only forwardly searches an item  $\rightarrow$  once it is in, it can't get out
- It does not account for the discrimination parameters of the items
